

**IN THE SPECIFICATION**

Please replace page 15, full paragraph one, with the following paragraph:

The final immunoglobulin concentrate can optionally be spray-dried into a powder. The powder allows for easier packaging and the product remains stable for a longer period of time than the raw globulin concentrate in liquid or frozen form. The immunoglobulin concentrate powder has been found to contain at least 15% by weight IgG, for example approximately 35-50% IgG. The immunoglobulin concentrate is then mixed with serum concentrate and other compounds to improve wettability.
